

# Tree Automata and Applications

## Exercise session 5

Luc Lapointe

luc.lapointe@ens-paris-saclay.fr

home.lmf.cnrs.fr/LucLapointe/

### Exercise 1 - To the infinity...

Let  $\Sigma = \{a, b\}$ . Define a DFHA  $\mathcal{A}$  such that  $L(\mathcal{A})$  is the set of all trees such that

For every leaf labeled with  $a$ , there is an ancestor from which there is a path whose nodes are labeled with  $b$ .

Here, *ancestor* means strict ancestor, and *from which there is a path* means that there is a path from a son of this ancestor to a leaf.

### Exercise 2 - PDL

**Definition (PDL)** The syntax of PDL is the following:

$$\varphi := a \mid \top \mid \neg\varphi \mid \varphi \vee \varphi \mid \langle \pi \rangle \varphi \quad (\text{position formulae})$$

$$\pi := \downarrow \mid \rightarrow \mid \leftarrow \mid \pi^{-1} \mid \pi; \pi \mid \pi + \pi \mid \pi^* \mid \varphi? \quad (\text{path formulae})$$

Let  $t$  be a tree. We define the semantic  $\llbracket \varphi \rrbracket_t$  (resp.  $\llbracket \pi \rrbracket_t$ ) as a set of positions of  $t$  (resp. a relation on positions of  $t$ ) by induction on the size of  $\varphi$  (resp.  $\pi$ ).

$$\llbracket a \rrbracket_t = \{w \in \text{Pos}(t) \mid t(w) = a\}$$

$$\llbracket \downarrow \rrbracket_t = \{(w, w.i) \mid w, w.i \in \text{Pos}(t)\}$$

$$\llbracket \top \rrbracket_t = \text{Pos}(t)$$

$$\llbracket \rightarrow \rrbracket_t = \{(w.i, w.(i+1)) \mid w.i, w.(i+1) \in \text{Pos}(t)\}$$

$$\llbracket \leftarrow \rrbracket_t = \{(w.(i+1), w.i) \mid w.i, w.(i+1) \in \text{Pos}(t)\}$$

$$\llbracket \neg\varphi \rrbracket_t = \text{Pos}(t) \setminus \llbracket \varphi \rrbracket_t$$

$$\llbracket \pi^{-1} \rrbracket_t = \llbracket \pi \rrbracket_t^{-1}$$

$$\llbracket \varphi_1 \vee \varphi_2 \rrbracket_t = \llbracket \varphi_1 \rrbracket_t \cup \llbracket \varphi_2 \rrbracket_t$$

$$\llbracket \pi_1; \pi_2 \rrbracket_t = \llbracket \pi_2 \rrbracket_t \circ \llbracket \pi_1 \rrbracket_t$$

$$\llbracket \langle \pi \rangle \varphi \rrbracket_t = \llbracket \pi \rrbracket_t^{-1}(\llbracket \varphi \rrbracket_t)$$

$$\llbracket \pi_1 + \pi_2 \rrbracket_t = \llbracket \pi_2 \rrbracket_t \cup \llbracket \pi_1 \rrbracket_t$$

$$\llbracket \pi^* \rrbracket_t = \llbracket \pi \rrbracket_t^*$$

$$\llbracket \varphi? \rrbracket_t = \Delta_{\llbracket \varphi \rrbracket_t} = \{(w, w) \mid w \in \llbracket \varphi \rrbracket_t\}$$

Let  $t$  be a tree and  $w, w' \in \text{Pos}(t)$ . We write:

- $t, w \models \varphi$  if  $w \in \llbracket \varphi \rrbracket_t$
- $t \models \varphi$  if  $t, \varepsilon \models \varphi$  and we say that  $t$  satisfies  $\varphi$
- $t, w, w' \models \pi$  if  $(w, w') \in \llbracket \pi \rrbracket_t$

Let  $t$  be the tree:

Which formulae are satisfied by  $t$ ?

1.  $\varphi_1 = \neg a \vee \langle \downarrow \rangle (\neg \langle \leftarrow \rangle \top \wedge b \wedge \langle \rightarrow^* \rangle (c \wedge \neg \langle \rightarrow \rangle \top))$
2.  $\varphi_2 = \neg a \vee \langle \downarrow \rangle (\neg \langle \leftarrow \rangle \top \wedge b \wedge \langle (\rightarrow; c?)^* \rangle (\neg \langle \rightarrow \rangle \top))$
3.  $\varphi_3 = \langle (a?; \downarrow)^* \rangle (a \wedge \neg \langle \downarrow \rangle \top)$

## Exercise 3 - The power of PDL?

Give a translation of PDL in MSO that preserves models. That is, given a position formula  $\varphi$  (resp. a path formula  $\pi$ ), construct a MSO formula  $\tilde{\varphi}$  (resp.  $\tilde{\pi}$ ) whose set of free variable is  $\{X_a \mid a \in \mathcal{F}\} \cup \{x\}$  (resp.  $\{X_a \mid a \in \mathcal{F}\} \cup \{x, y\}$ ) such that

$$t, w \models \varphi \text{ iff } (P_a(t))_{a \in \mathcal{F}}, w \models \tilde{\varphi}$$

$$\text{resp. } t, w, w' \models \pi \text{ iff } (P_a(t))_{a \in \mathcal{F}}, w, w' \models \tilde{\pi}$$

where  $P_a(t) = \{w \in \text{Pos}(t) \mid t(w) = a\}$ .

## Exercise 4 - Propositional Linear-time Temporal Logic

The logic **PTL** is defined as follows:

**Syntax**  $P$  is a finite set of *propositional variables*. Each symbol of  $P$  is an atomic formula. If  $\varphi$  and  $\psi$  are formulae, then the following also are:

$$\neg\varphi, \varphi \wedge \psi, \varphi \vee \psi, \varphi \rightarrow \psi, \varphi \mathbf{U}\psi, \mathbf{N}\varphi, \mathbf{L}\varphi$$

**Semantics** Let  $P^*$  be the set of words over the alphabet  $P$ . A word  $w \in P^*$  is identified with the sequence of letters  $w(0)w(1)\dots w(|w| - 1)$ .  $w(i..j)$  is the word  $w(i)\dots w(j)$ . The satisfaction relation is defined by:

- If  $p \in P$ ,  $w \models p$  if and only if  $w(0) = p$ .
- The interpretation of logical connectives is the usual one.
- $w \models \mathbf{N}\varphi$  if and only if  $|w| \geq 2$  and  $w(1..|w| - 1) \models \varphi$ .
- $w \models \mathbf{L}\varphi$  if and only if  $|w| = 1$  and  $w \models \varphi$ .
- $w \models \varphi \mathbf{U}\psi$  if and only if there is an index  $i \in \llbracket 0, |w| - 1 \rrbracket$  such that for all  $j \in \llbracket 0, i - 1 \rrbracket$ ,  $w(j..|w| - 1) \models \varphi$  and  $w(i..|w| - 1) \models \psi$ .

Let us recall that the language defined by a formula  $\varphi$  is the set of words  $w$  such that  $w \models \varphi$ .

1. What is the language defined by  $\mathbf{N}(p_1 \mathbf{U} p_2)$  (with  $p_1, p_2 \in P$ ?)
2. Give **PTL** formulae defining respectively  $P^* p_1 P^*$ ,  $p_1^*$ ,  $(p_1 p_2)^*$ .

## Homework - PTL to WS1S

Give a first-order WS1S formula (i.e. without second-order quantification) that defines the same language as  $\mathbf{N}(p_1 \mathbf{U} p_2)$ .
